K PLUS SMART LIFE ASSISTANT CHALLENGE

EsKrow+.

"Buy Anywhere. Pay with Protection."

TRACK: CYBER SECURITY & DIGITAL TRUST

1 Problem Statement

First Jobbers (22–30) increasingly buy from unfamiliar sellers on social commerce (Facebook, Instagram, LINE), paying directly with no **protection against fake sellers or scammers**, non-delivery, or fraud — a risk that hits hardest for those with limited savings.

THB 63 billion
in **losses** from **online crime** in Thailand (Mar 2022 – July 2024)

1.8 million accounts
suspended via the Bank of Thailand's Central Fraud Registry

2 Proposed Solution

"We don't build another marketplace. We secure the transactions happening outside it."

An escrow-like Transaction Protection service, separate from normal K PLUS transfers, guarding specifically against **seller risk and shipment risk** — built on Zero-Trust, so no single K PLUS admin can authorize a release alone.

CREATE DEAL — Agree on price & terms
→ **RISK CHECK** — Screen seller/account
→ **ESCROW** — Funds held securely, Policy-Controlled Payment Released
→ **VERIFY TRACKING** — Confirm real shipment
→ **RELEASE** — Pay out or refund

COVERS (MVP Scope)

- Fake / high-risk sellers
- Payment collected, no shipment
- Claimed shipment with no real proof

NOT COVERED

- Product quality / authenticity
- Wrong or damaged items
- Judging physical product condition

"We don't verify what's in the box. We verify identity, money, transaction state, and the shipment event — that's what a bank can actually stand behind."

3 Target Users

First Jobbers aged 22–30, K PLUS users who buy and sell with individuals or small sellers through social media and currently have no tool to manage financial risk on transactions and have to confront with untrusted deal that happen outside e-commerce platforms.

4 Value Proposition

For First Jobbers

- Buy confidently from unfamiliar sellers
- Money stays protected until delivery is confirmed
- A transparent, auditable dispute process

For K PLUS

- A new digital trust service beyond transfers
- Deeper relationships with First Jobbers
- A foundation for future fee-based models

5 Track Perspective: Cyber Security & Digital Trust

The project centers on security architecture, not just AI or blockchain — the differentiator is a system that **removes the need to trust any single person, including K PLUS admins,** via fine-grained access control and a full audit trail.

Zero-Trust Admin
No single K PLUS employee can access, modify, or release funds alone. (every sensitive action requires shared authorization.)

RBAC (Role-Based Access Control)
Each role (support, risk analyst, dispute officer) can see and do only what its job requires, nothing more.

Dual Approval
High-risk fund releases need two separate admins to confirm before money moves (a four-eyes check built into the system, not a manual habit).

Behavioral Risk Signal
The system watches for patterns like new devices, unusual timing, or abnormal transaction speed to flag risk before funds are released.

Tamper-Evident Audit Log
Every action in a deal is recorded and hashed, so the full history can be verified and nothing can be silently altered afterward.

Policy-Based Authorization
Every action is decided by fixed rules (role + risk level + deal state), not human judgment in the moment (decisions stay consistent and can't be bypassed)

" Don't trust the seller. Don't blindly trust the middleman. Trust the system. "
